Class 5 Data Viz with ggplot

Peter Sax A18133704

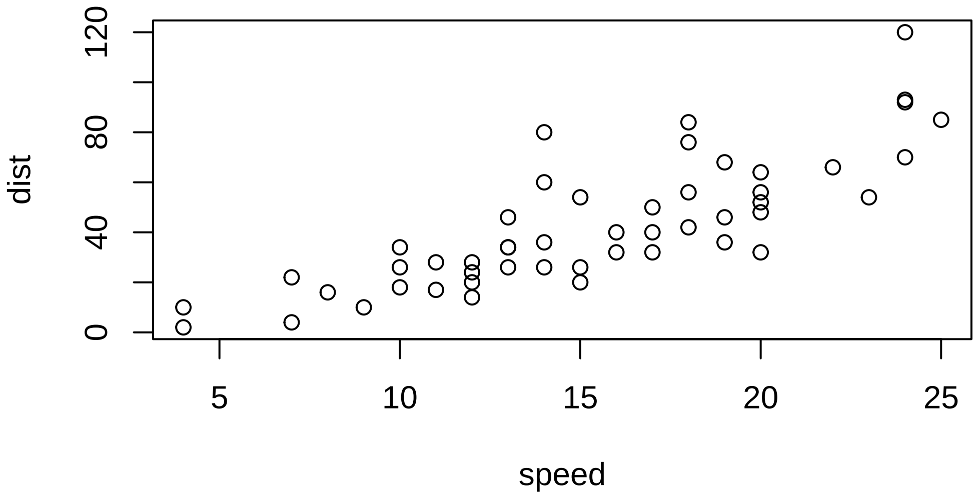
Table of contents

Background

There are many graphics syetems available in R. These include "base" R and tones of add-on packages like **ggplot2**.

Let's compare "base" and **ggplot2** briefly. We can use some example data that is built-in with R called `cars`:

```
plot(cars)
```



How can we do this with **ggplot2**

First we need to install the package. We do this with `install.packages("ggplot2")`. I only need to do this once and then it will be available on my computer from then on.

> Key point: I only install packages in the R console now with quarto docs or R scripts.

Before I use any add-on package, I must load it up with a call to `library()`.

```r
install.packages('ggplot2', repos = "http://cran.us.r-project.org")
```

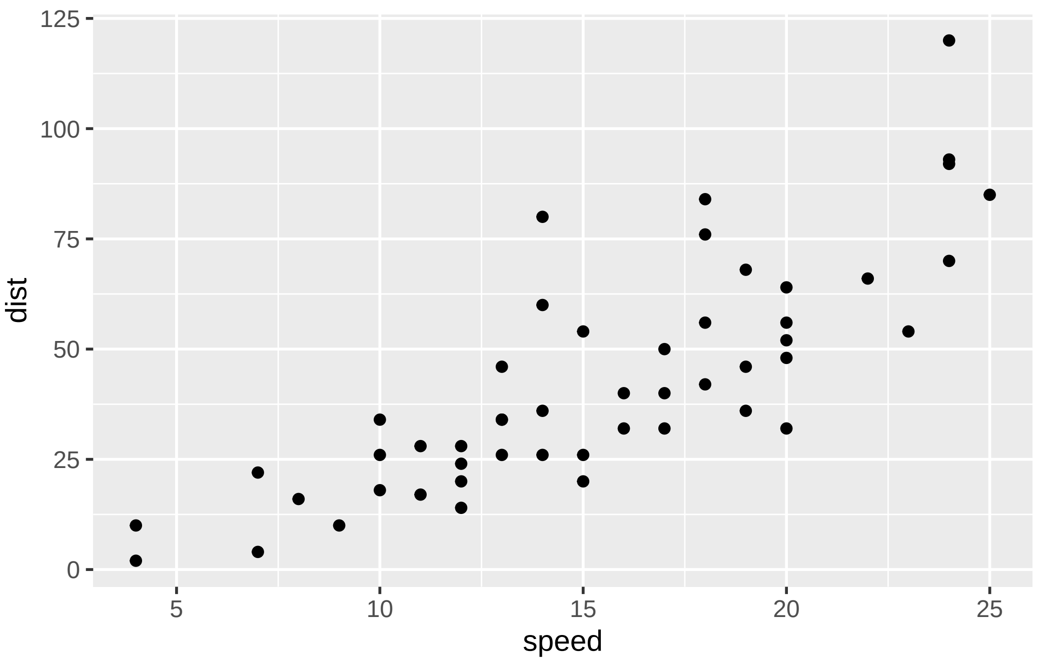
```
Installing package into 'C:/Users/peter/AppData/Local/R/win-library/4.4'
(as 'lib' is unspecified)
```

```
package 'ggplot2' successfully unpacked and MD5 sums checked

The downloaded binary packages are in
    C:\Users\peter\AppData\Local\Temp\Rtmpig1UM3\downloaded_packages
```

```r
library(ggplot2)
```

```r
ggplot(cars, aes(x=speed, y=dist)) +
  geom_point()
```



For “simple” plots ggplot is much more verbose than base R but the defaults are nicer and for complicated plots it becomes much more efficient and structured.

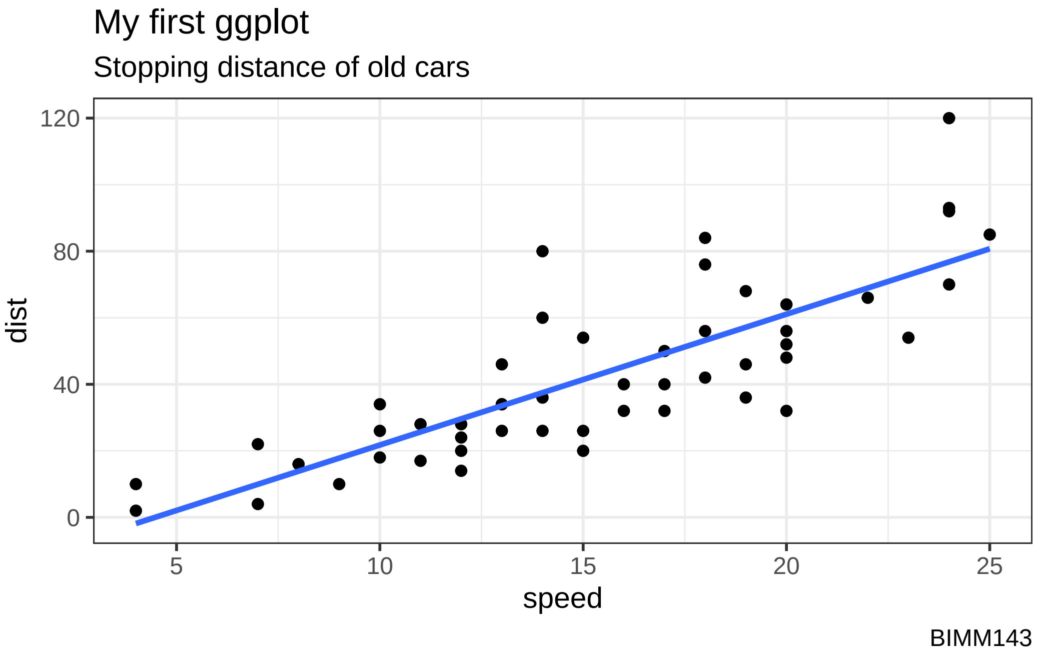
> Q. Add a line to show the relationship of speed to stopping distance (i.e. add another “layer”)

```r
p <- ggplot(cars, aes(speed, dist)) +
  geom_point() +
  geom_smooth(se = FALSE, method = "lm")
```

I can always save any ggplot object (i.e. plot) and then use it later

```r
p + labs(title = "My first ggplot", subtitle = "Stopping distance of old cars", caption = "B
  theme_bw()
```

```
`geom_smooth()` using formula = 'y ~ x'
```



Q. Add a title and subtitle to the plot

Using different aes and geoms

Gene expression plot

Read input data into R

```r
url <- "https://bioboot.github.io/bimm143_S20/class-material/up_down_expression.txt"
genes <- read.delim(url)
head(genes)
```

```
        Gene Condition1 Condition2      State
1      A4GNT -3.6808610 -3.4401355 unchanging
2       AAAS  4.5479580  4.3864126 unchanging
3      AASDH  3.7190695  3.4787276 unchanging
4       AATF  5.0784720  5.0151916 unchanging
5       AATK  0.4711421  0.5598642 unchanging
6 AB015752.4 -3.6808610 -3.5921390 unchanging
```

How many genes are in this database?

```r
nrow(genes)
```

```
[1] 5196
```

> Q. How many columns are there?

```r
ncol(genes)
```

```
[1] 4
```

> Q. What are the column names?

```r
colnames(genes)
```

```
[1] "Gene"       "Condition1" "Condition2" "State"
```

> Q. How many "up" and "down" regulated genes are there?

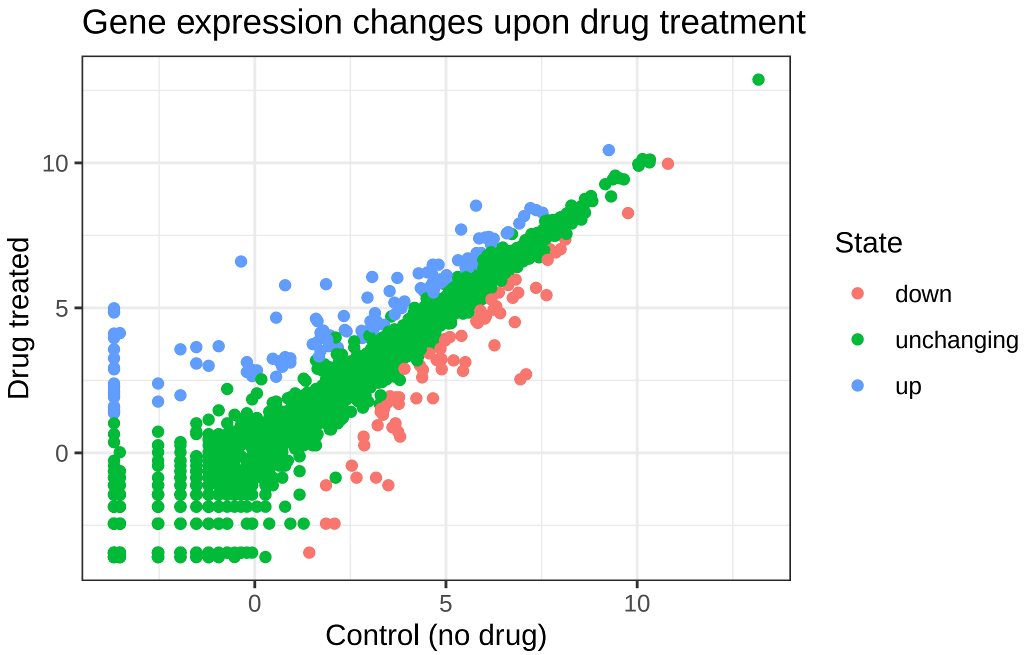
```r
table(genes$State)
```

```

      down unchanging         up 
        72       4997        127 
```

> Q. Make a first plot of this data

```r
ggplot(genes) +
  aes(x=Condition1, y=Condition2, col=State) +
  geom_point() +
  labs(title="Gene expression changes upon drug treatment", x="Control (no drug)", y= "Drug
  theme_bw()
```



Using different geoms

Let’s plot some aspects of the in-built `mtcars` dataset.

```
head(mtcars)
```

```
                   mpg cyl disp  hp drat    wt  qsec vs am gear carb
Mazda RX4         21.0   6  160 110 3.90 2.620 16.46  0  1    4    4
Mazda RX4 Wag     21.0   6  160 110 3.90 2.875 17.02  0  1    4    4
Datsun 710        22.8   4  108  93 3.85 2.320 18.61  1  1    4    1
Hornet 4 Drive    21.4   6  258 110 3.08 3.215 19.44  1  0    3    1
Hornet Sportabout 18.7   8  360 175 3.15 3.440 17.02  0  0    3    2
Valiant           18.1   6  225 105 2.76 3.460 20.22  1  0    3    1
```

Q. Scatter plot of `mpg` vs `disp`

```
p1 <- ggplot(mtcars) + aes(mpg, disp) + geom_point()
```

Q. Box plot of `gear` vs `disp`

```
p2 <- ggplot(mtcars) + aes(gear, disp, group=gear) + geom_boxplot()
```

Q. Bar plot of `carb`

```
p3 <- ggplot(mtcars) + aes(carb) + geom_bar()
```

Q. Smooth of `disp` vs `qsec`

```
p4 <- ggplot(mtcars) + aes(disp, qsec) + geom_smooth()
```

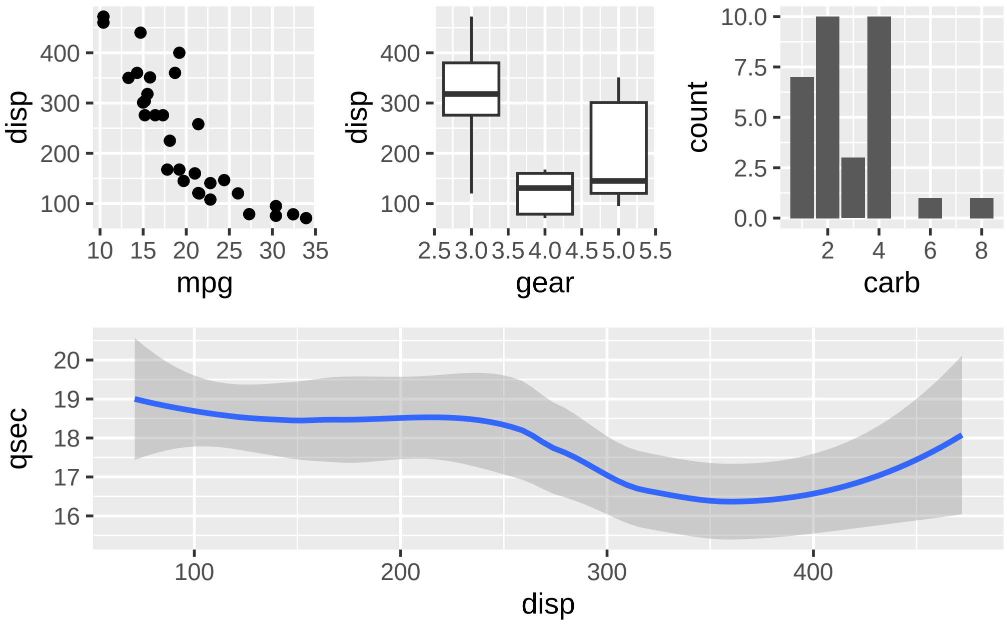
I want to combine all these plots into one figure with multiple panels.

We can use the **patchwork** package to do this.

```
library(patchwork)

( (p1 | p2 | p3) / p4)
```

```
`geom_smooth()` using method = 'loess' and formula = 'y ~ x'
```



```
# File location online
url <- "https://raw.githubusercontent.com/jennybc/gapminder/master/inst/extdata/gapminder.tsv

gapminder <- read.delim(url)
```

```
head(gapminder)
```

```
      country continent year lifeExp      pop gdpPercap
1 Afghanistan      Asia 1952  28.801  8425333  779.4453
2 Afghanistan      Asia 1957  30.332  9240934  820.8530
3 Afghanistan      Asia 1962  31.997 10267083  853.1007
4 Afghanistan      Asia 1967  34.020 11537966  836.1971
5 Afghanistan      Asia 1972  36.088 13079460  739.9811
6 Afghanistan      Asia 1977  38.438 14880372  786.1134
```

Q. How many countries are in this dataset?

```
length(table(gapminder$country))
```

```
[1] 142
```

```
ggplot(gapminder) + aes(gdpPercap, lifeExp, col = continent, size = pop) +
  geom_point(alpha = 0.3) +
  facet_wrap(~continent) +
  theme_bw()
```
